

## ABSTRACT

The present invention relates to a system and methodology to facilitate automated retrieval and classification of information. A system and associated methods are provided that facilitate generation of code and/or documents. The system includes a component that receives data relating to at least one of a user's request for desired code functionality and one or more desired documents. A mapping component correlates parsed subsets of the data to specific functional objects respectively located remote from the user, wherein a generator employs the functional objects to form at least one of the desired code and the documents.
